Brownbag Roundtable

Bringing Data Visualization to Mapping and Analyzing China's Global Footprint

Where is China building, lending, investing and connecting—and what changes on the ground when it does? Mapping Global China is an open-access research initiative that brings together China experts, data-visualization researchers and WPI students to build original datasets, interactive maps and narrative stories about how China is reshaping places around the world. Join the team as they share new tools and findings, and reflect on what mapping can reveal about Global China.
