Atomic Structure

Metallic Bonding

“Sea of Electrons”

Properties of Metals

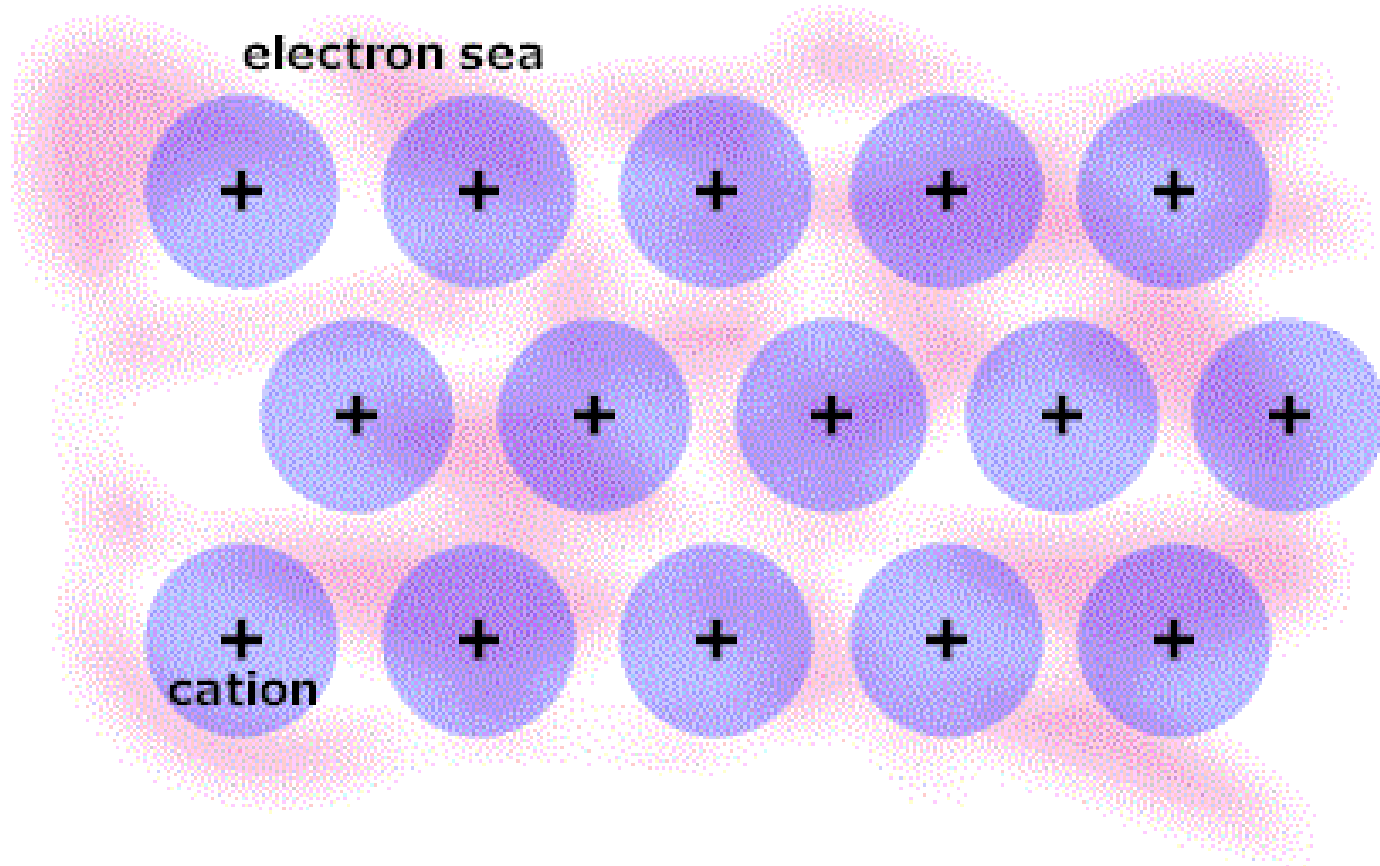

Metals are strong.

Properties of Metals

Metals have a lustrous look when polished.

Properties of Metals

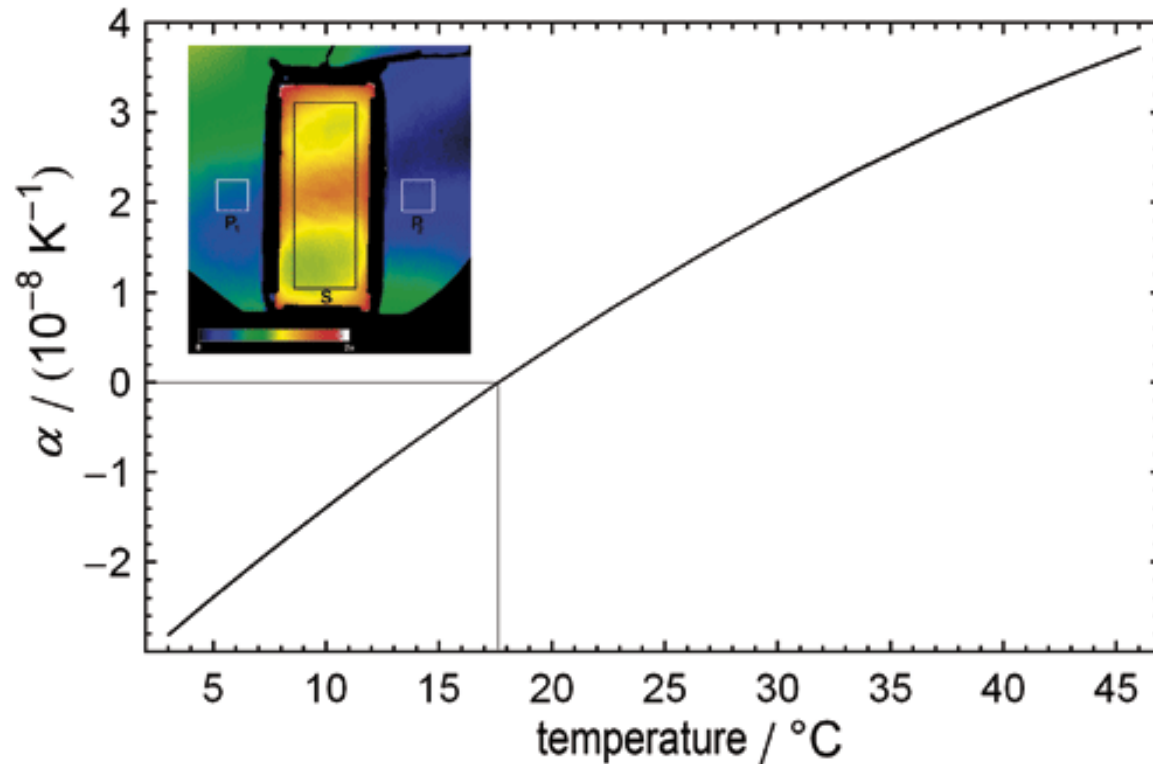

Metals are flexible.

Properties of Metals

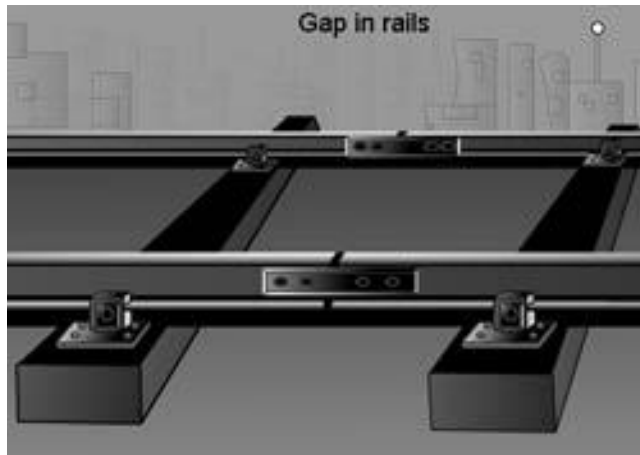

Metals are malleable.

Properties of Metals

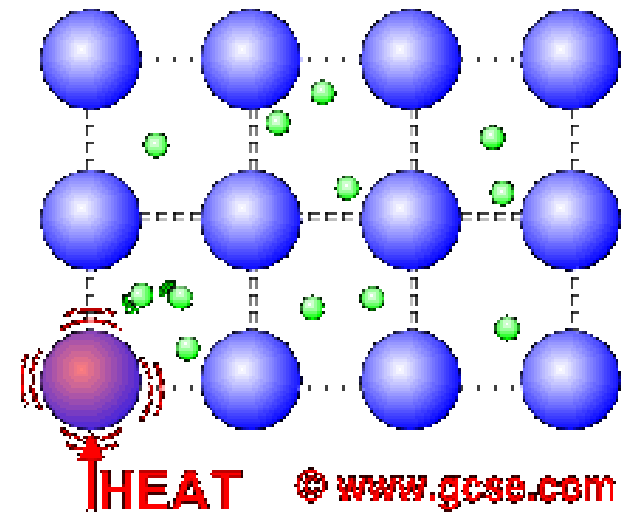

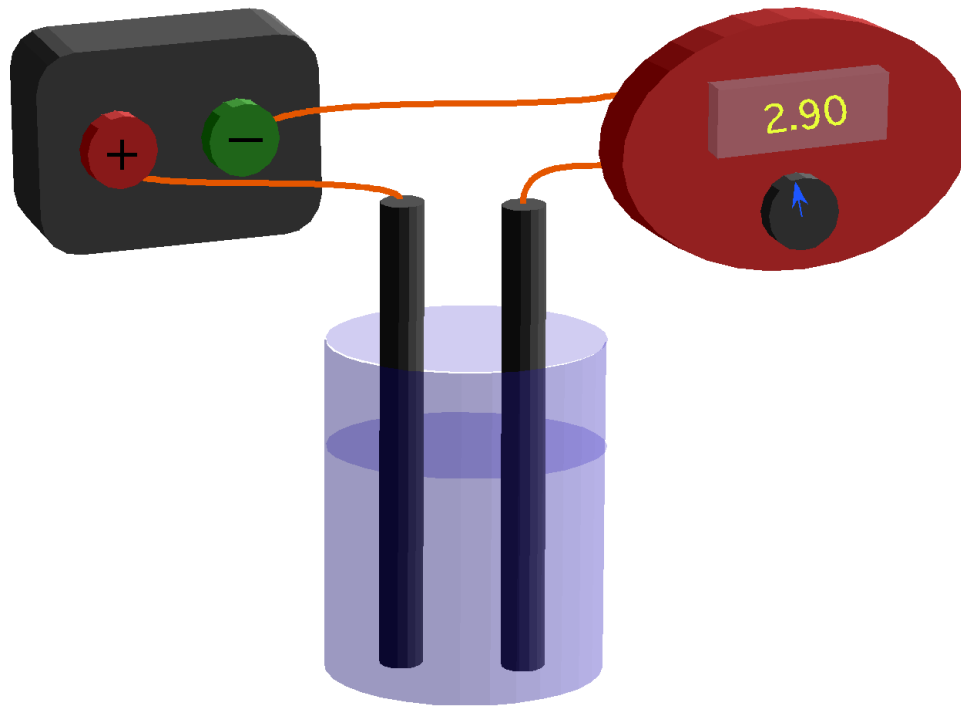

Metals expand when heated.

Thermal Expansion

Properties of Metals

Metals have a very high conductivity rate of heat and electricity.

Commercial Applications

Copper

Aluminum

Cast Iron

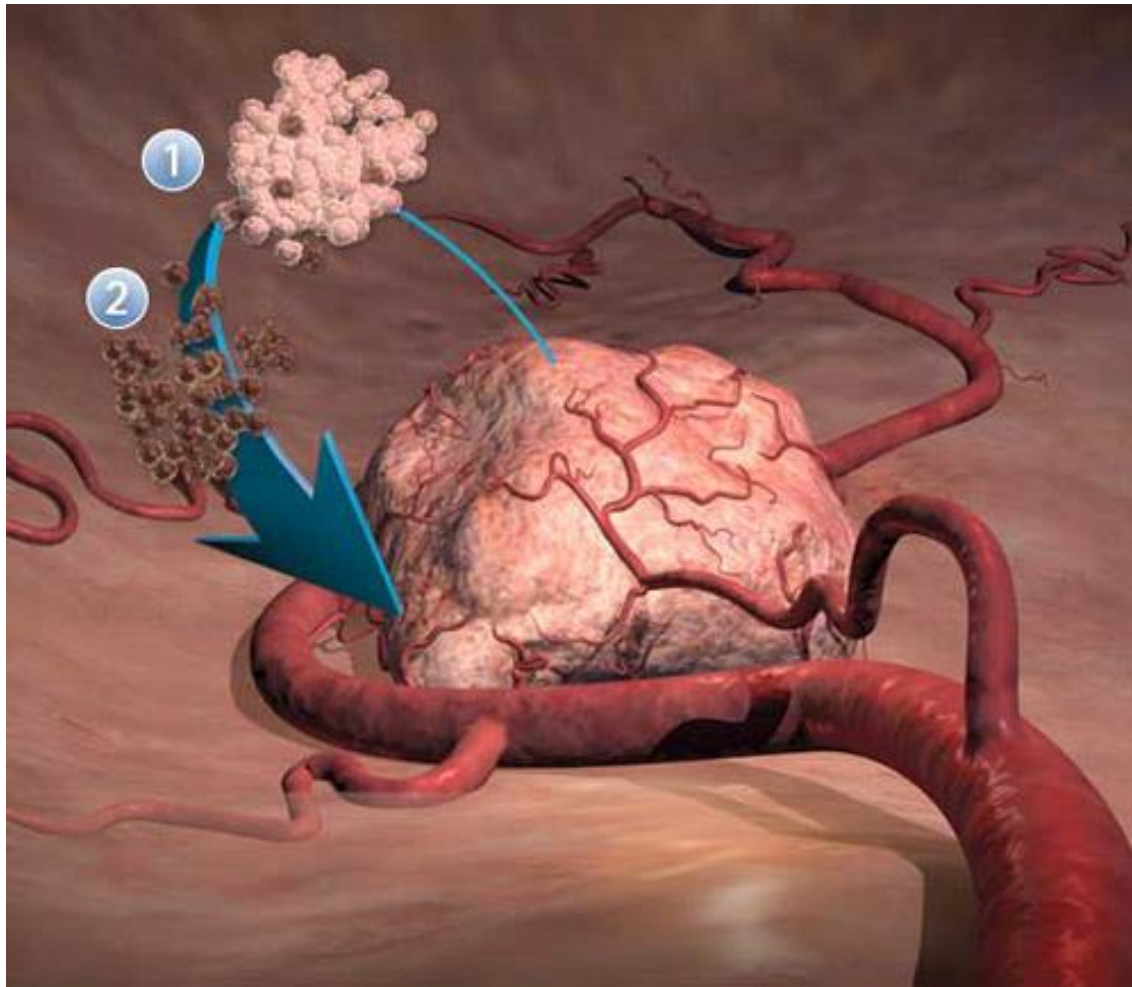

Steel

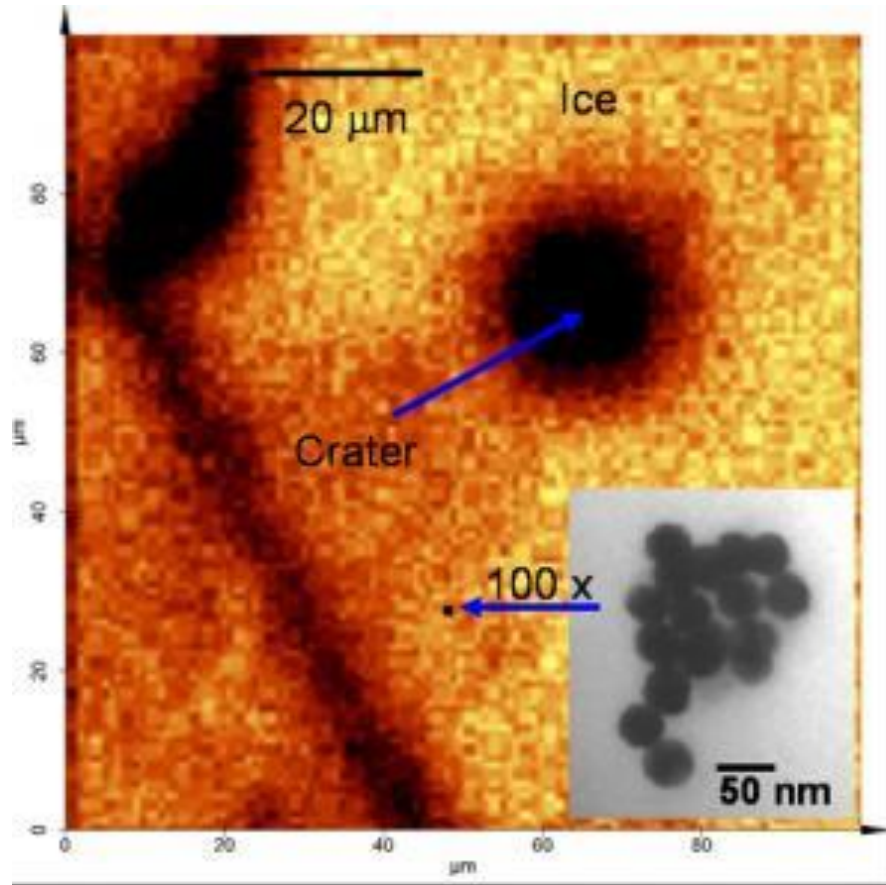

Cookware

Medical Applications

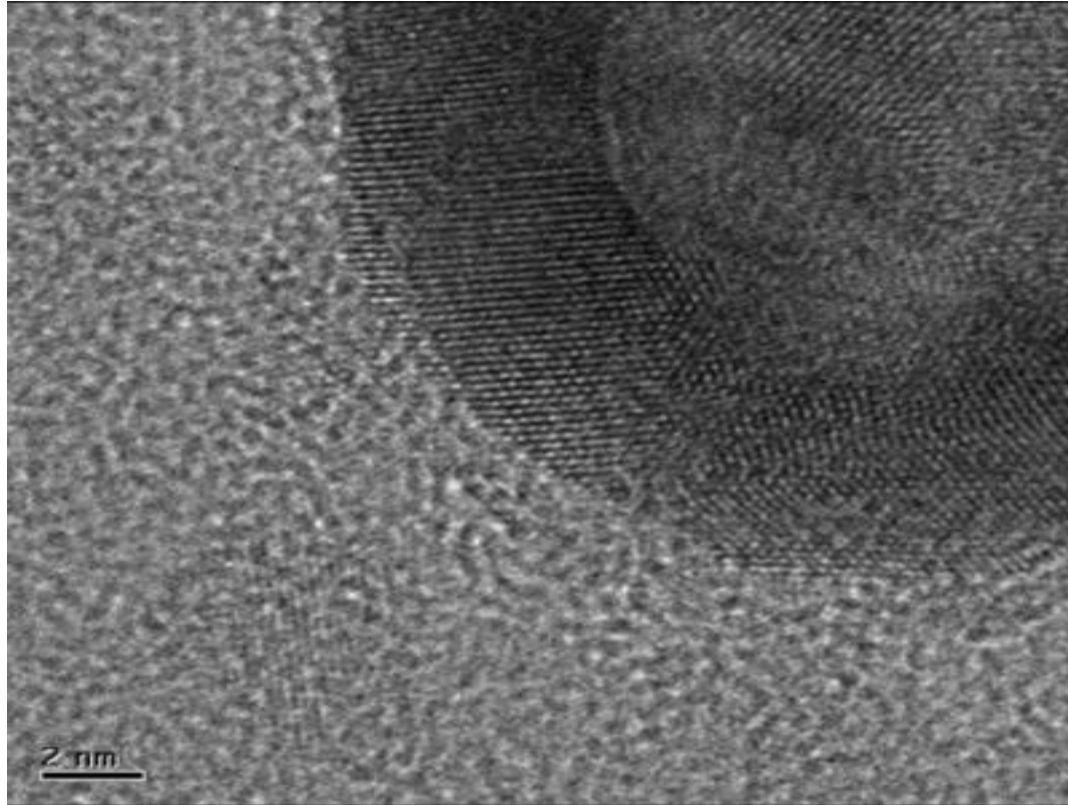

Using laser light, Ohio University scientists uses gold nanoparticles to kill cancer tumors.

Medical Applications

Metal nanoparticles, such as gold, can heat an area up to 1,000 times its size.

Medical Applications

A short peptide is attached to the nanospheres of gold that enabled them to bind to tumor cells.

Medical Applications

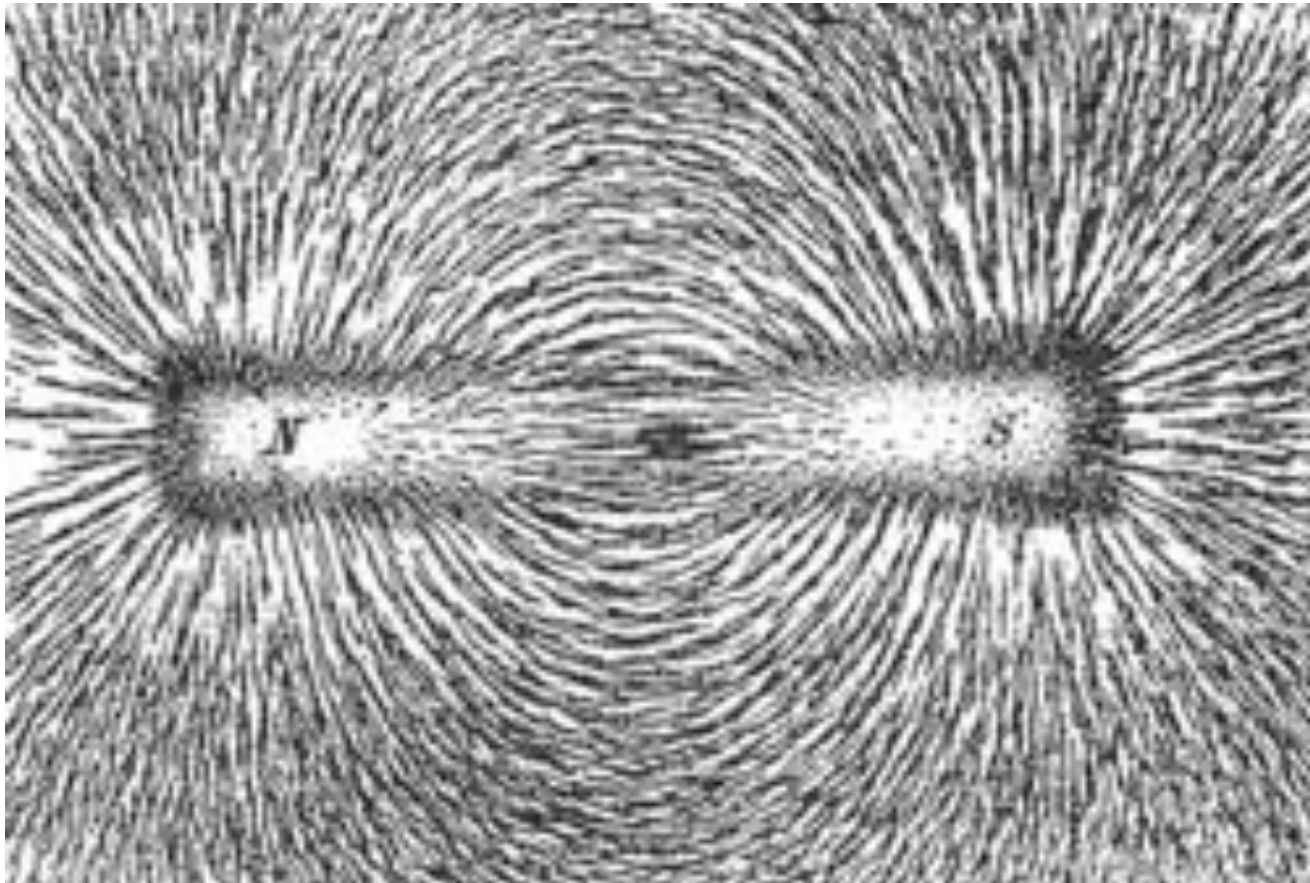

Using a near-infrared light from a laser, heat the gold nanospheres and selectively kill the cancer cells to which the particles were bound.

Electrical Applications

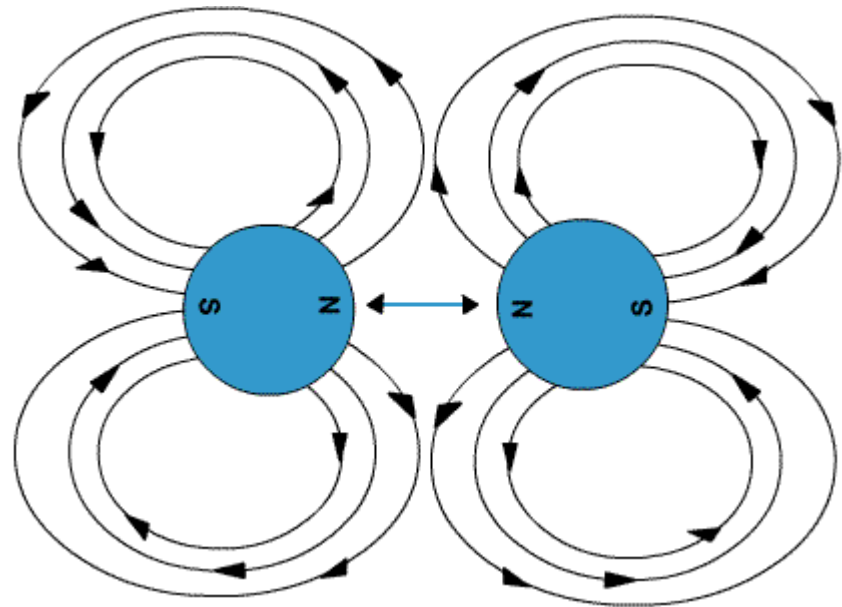

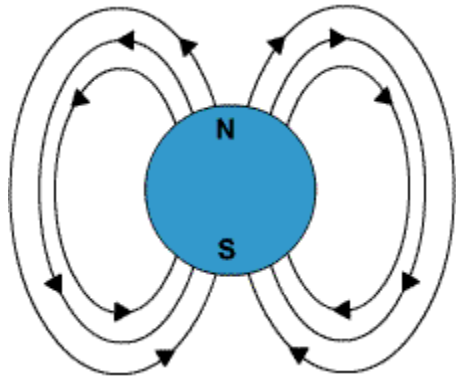

Properties of Metals

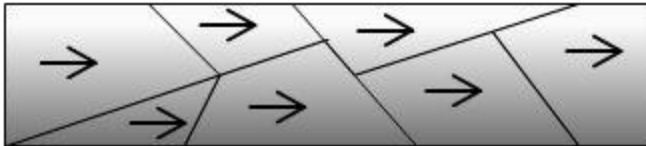

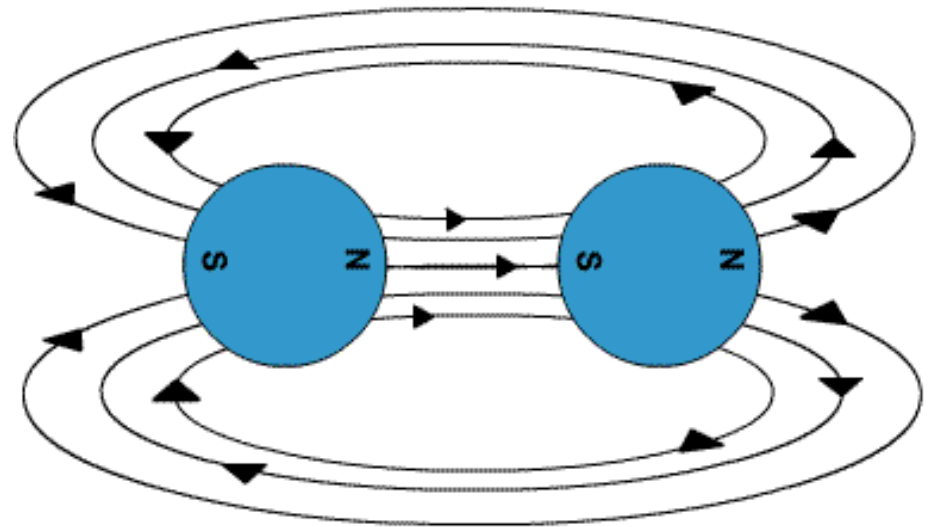

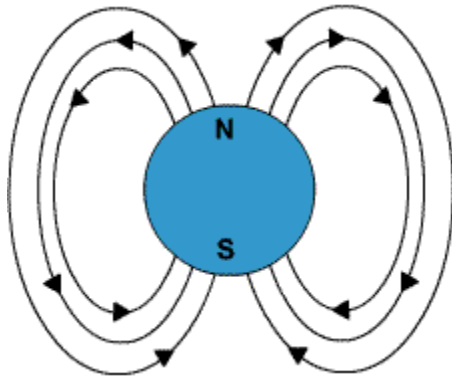

Certain metals can be magnetic.

Non-Magnetic Metals

Magnetic Metals

Properties of Metals

Metals are crystalline in structure.

Crystal Structures of Metals

• Aluminum	FCC	• Nickel	FCC
• Cadmium	HCP	• Niobium	BCC
• Chromium	BCC	• Platinum	FCC
• Cobalt	HCP	• Polonium	Cubic
• Copper	FCC	• Silver	FCC
• Gold	FCC	• Titanium	HCP
• Iron	BCC	• Vanadium	BCC
• Lead	FCC	• Zinc	HCP
• Magnesium	HCP	• Zirconium	HCP

Disadvantages of Metals

Metals corrode!

Unit #1: History of Metals

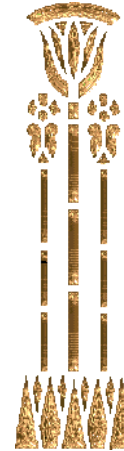

Metallurgy

Metallurgy is one of the oldest applied sciences.

The history of metals is closely linked to that of coins and gemstones.

Metallurgy

As early as 3400 B.C., at the beginning of the historical period, the Egyptians had an intimate knowledge of gold, copper ores and of processes of extracting metals.

Metallurgy

Metals were also known to the Mesopotamians, Greeks and the Romans.

Native Metals

Copper

Gold

Mercury

Silver

Native Metals

Iron

Iron was available to the ancients in small amounts from meteors.

Native iron is easily distinguishable because it contains 6-8% nickel.

Copper Age (~4000 B.C.)

The first metal to be used was copper.

Copper Age (~4000 B.C.)

The first tools, implements & weapons were made from copper.

Copper Age (~4000 B.C.)

The oldest known casting in existence, a pure copper frog, was cast in Mesopotamia.

Bronze Age (~3000 B.C.)

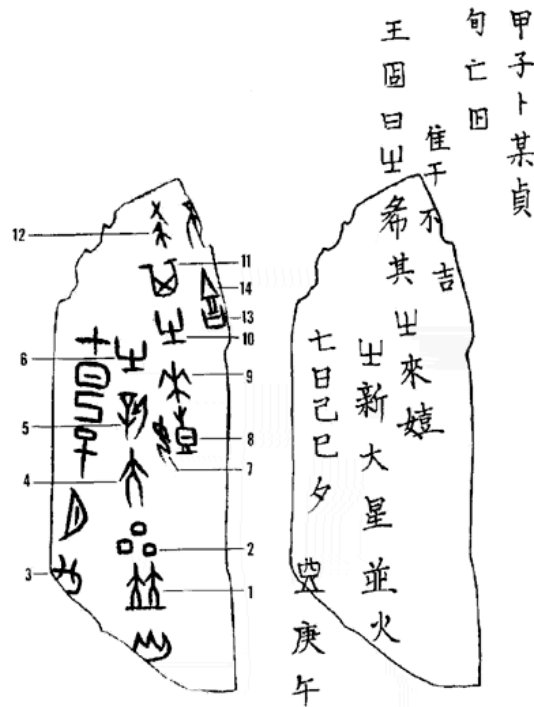

Bronze was the first alloy used.

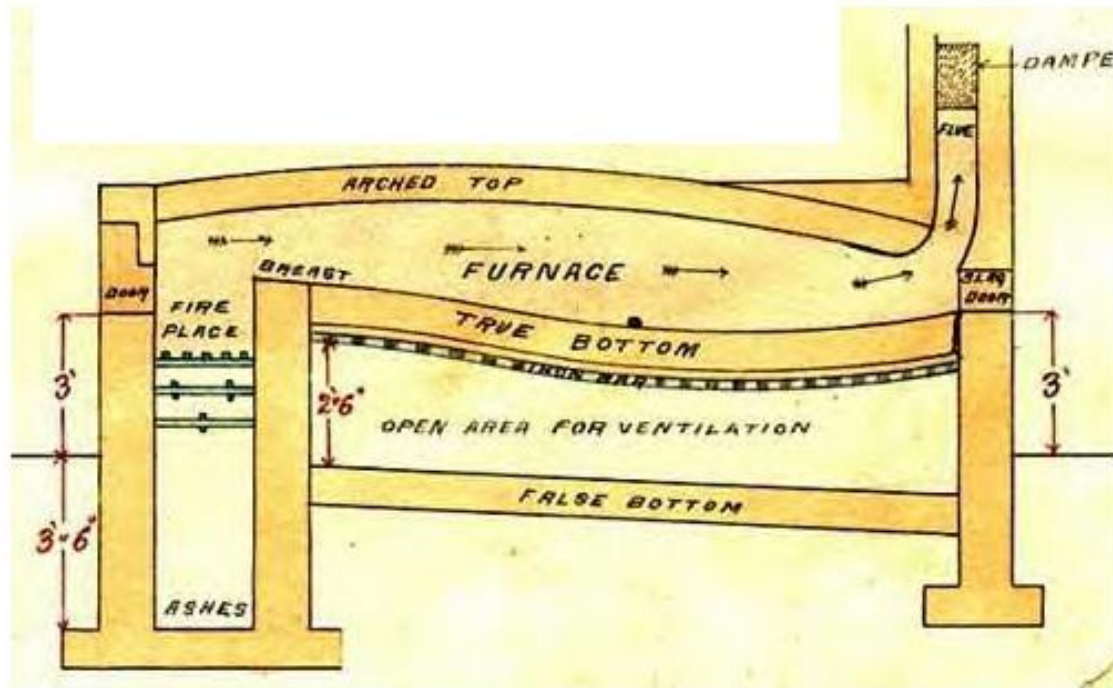

Bronze = Copper & 5-10% Tin

Bronze Age (~3000 B.C.)

New discoveries near Ban Chiang, Thailand, indicate that bronze technology was maybe known there as early as 4500 BC!

Iron Age (~2000 B.C.)

Iron smelting began in Egypt.

Process of Iron Smelting

A mixture of iron and oxide impurities is heated to about $1,500^{\circ}$ C. Molten iron is drawn off on one side, and slag (waste) on the other.

Iron Age (~2000 B.C.)

Iron weapons revolutionized warfare and iron implements did the same for farming.

Iron Pillar ~ 400A.D.

This iron pillar dating to 400 A.D., remains standing today in Delhi, India. Corrosion to the pillar has been minimal a skill lost to current ironworkers.

Cast Iron (~800)

Chinese were the first in the production of cast iron.

Cast Iron (~800)

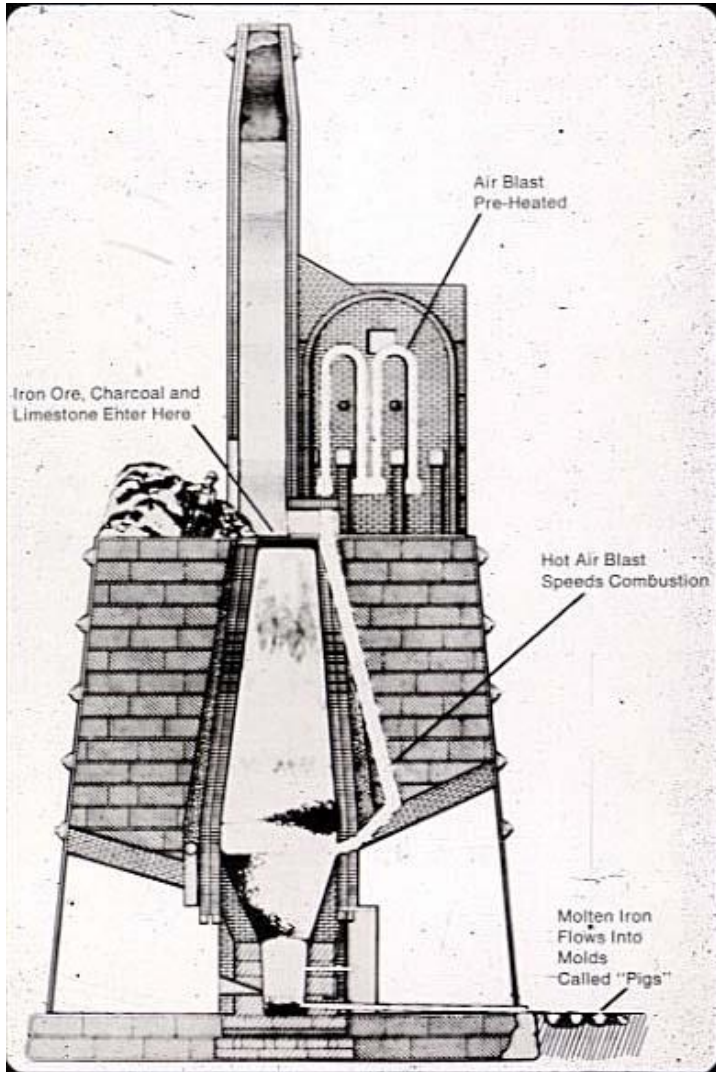

Molten iron is "cast" into forms made of sand.

Steel (~500)

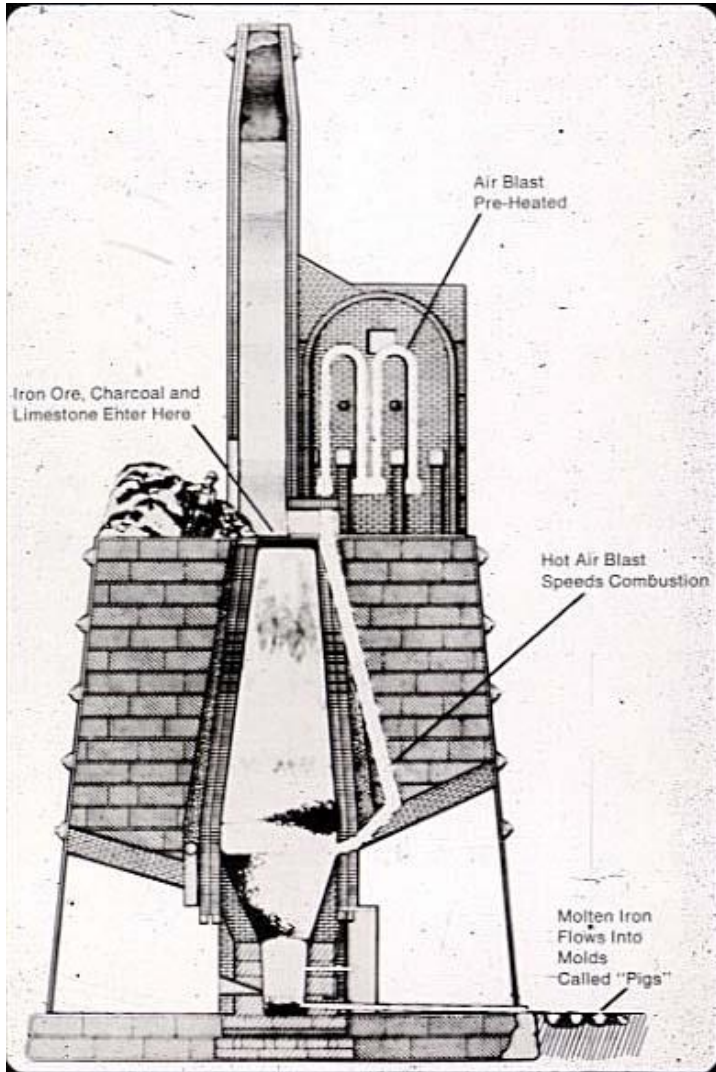

How To Smelt Iron?

Wood

Wood was needed as timber and it takes too much wood so smelt iron.

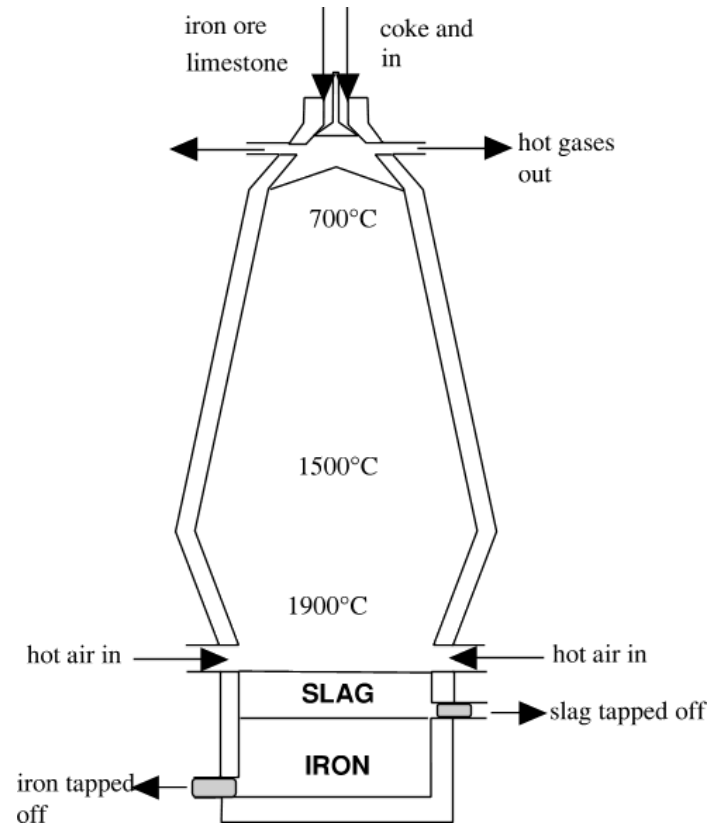

How To Smelt Iron?

Coal

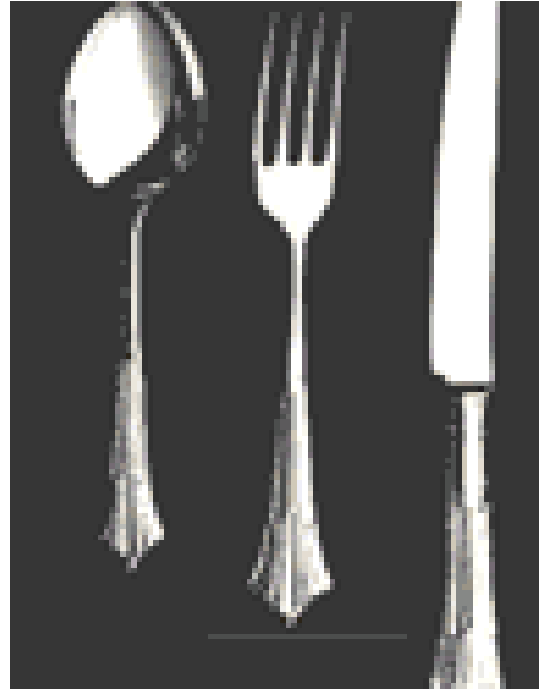

Although cheap and plentiful, coal contained sulphur that made the iron too brittle to be of any use.

Abraham Darby

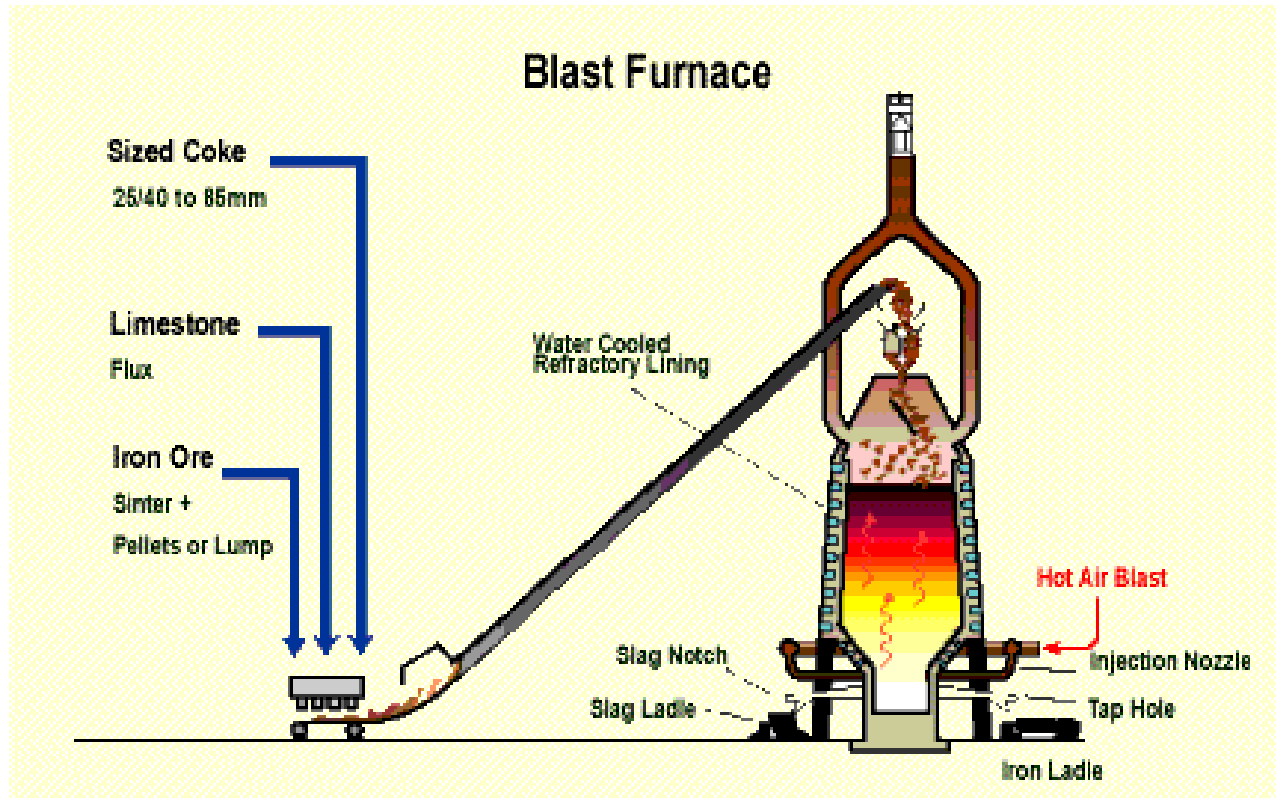

In 1709, Abraham Darby finally succeeded in smelting iron with coke.

1750

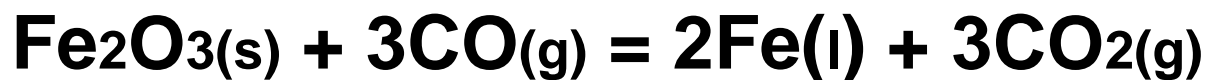

Steel becomes the world's most used material.

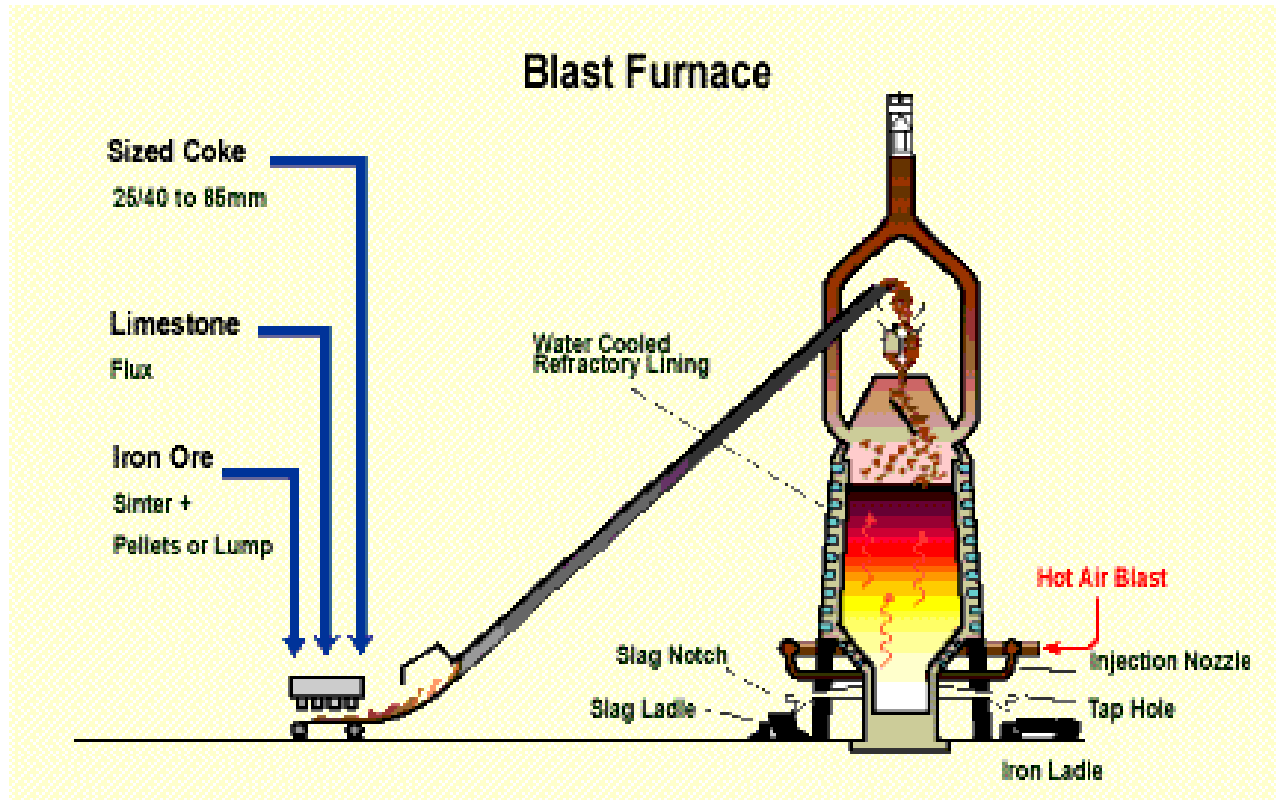

Steel Production Today

Step 1:

Steel Production Today

Step 2:

Molten iron is mixed with carbon & other elements.

1850

Charles Martin Hall

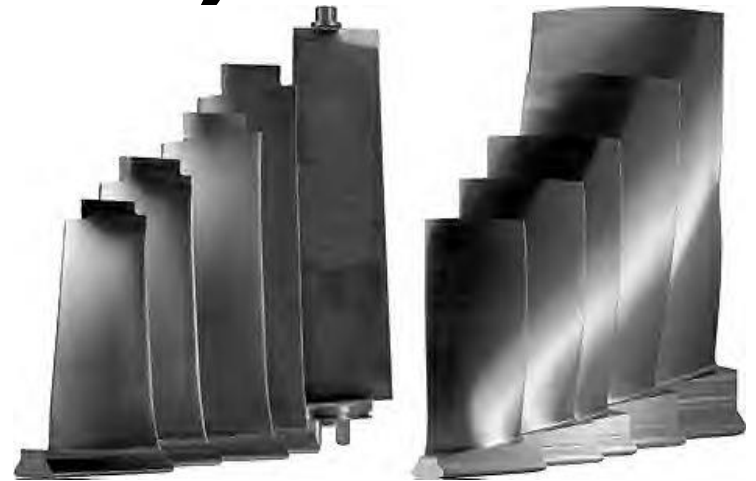

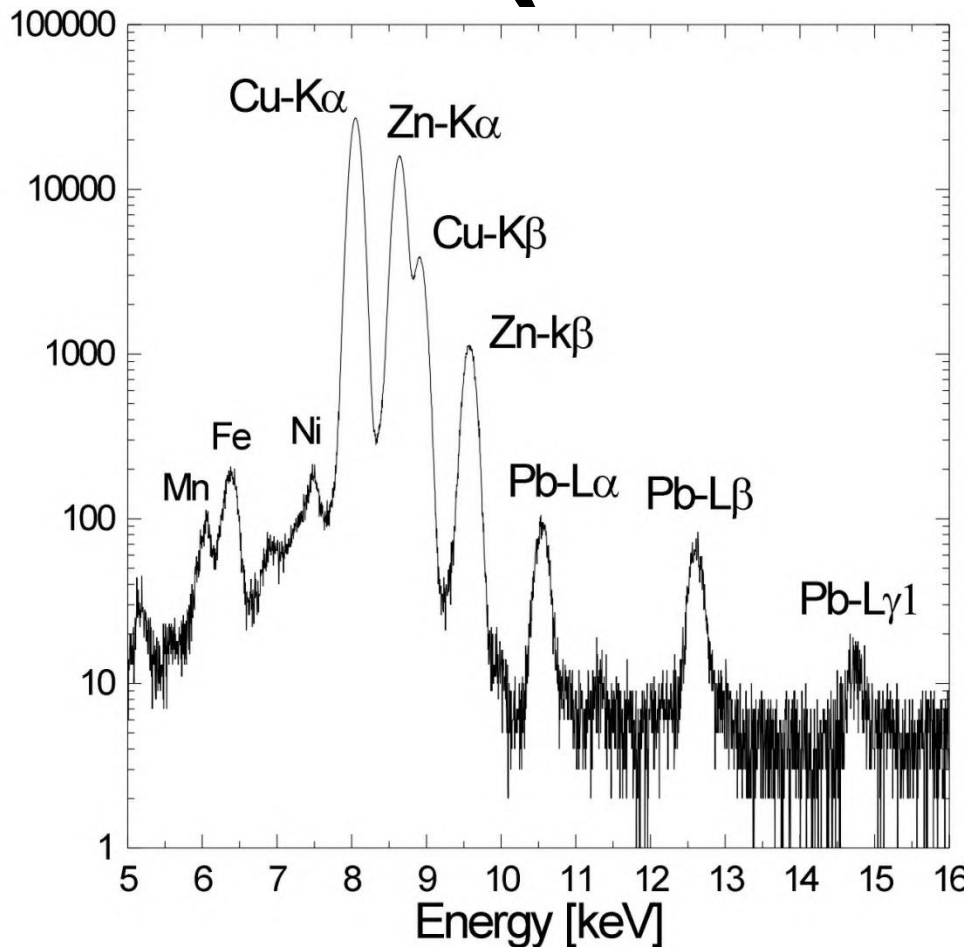

***Isolated Pure
Aluminum***

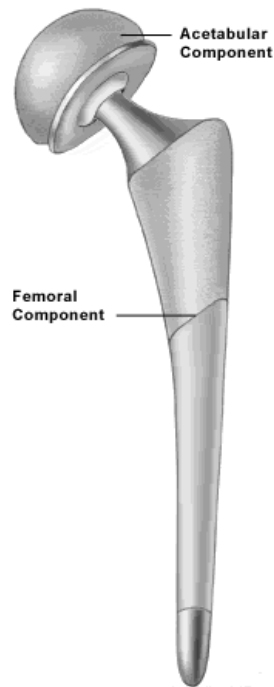

1900

Specialty Alloys (1935-1955)

Human Body Parts (1955-present)

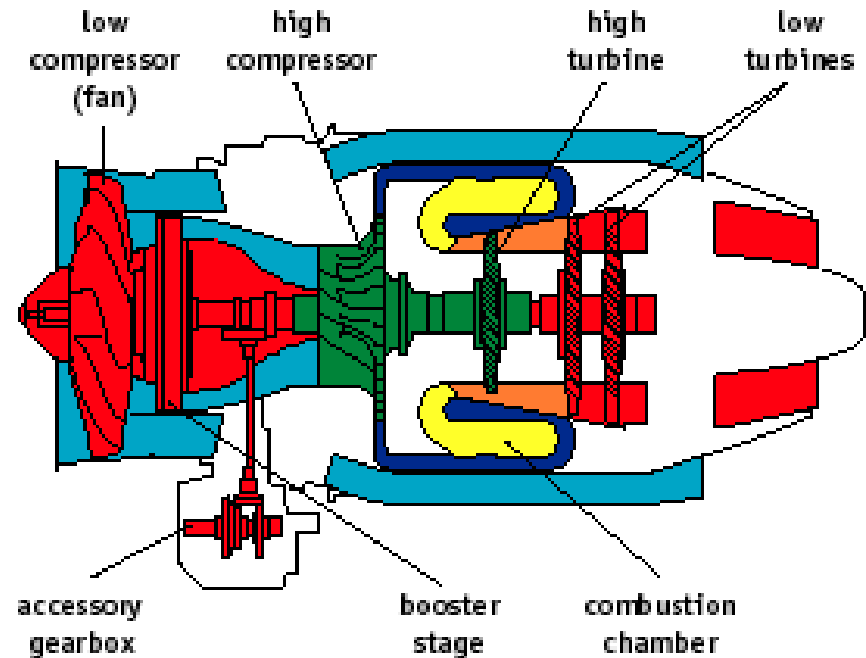

LesdingMD.com © 2001

High quality alloys of titanium & cobalt.

Super Alloys (1970-Present)

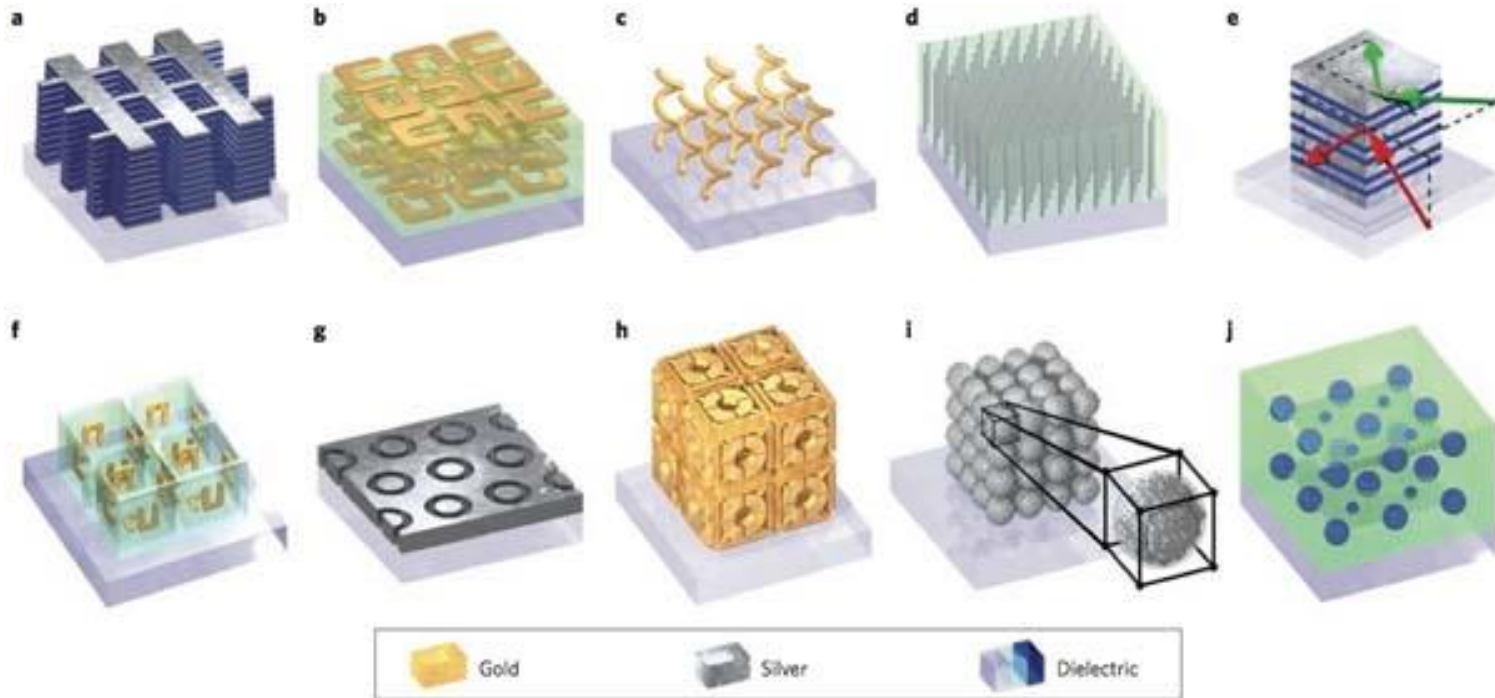

Since they can sustain high temperatures, super alloys were developed for jet engines.

Transparent Aluminum (2010)

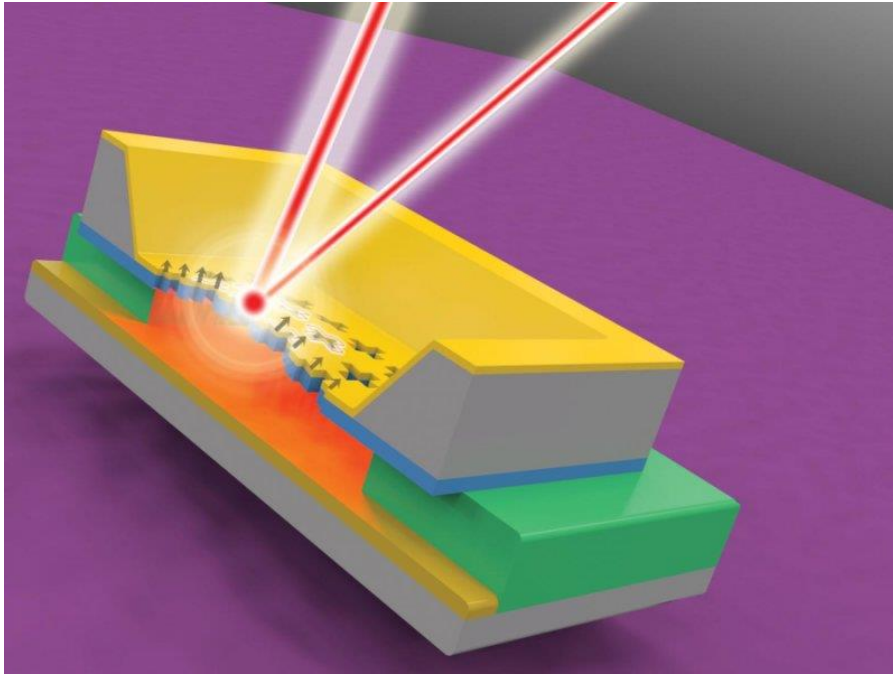

***Fine grained aluminum is heated to 1200° C!
3X tougher than steel & it's see-through!***

Metamaterials (2015)

Materials designed that use light to manipulate its mechanical properties.

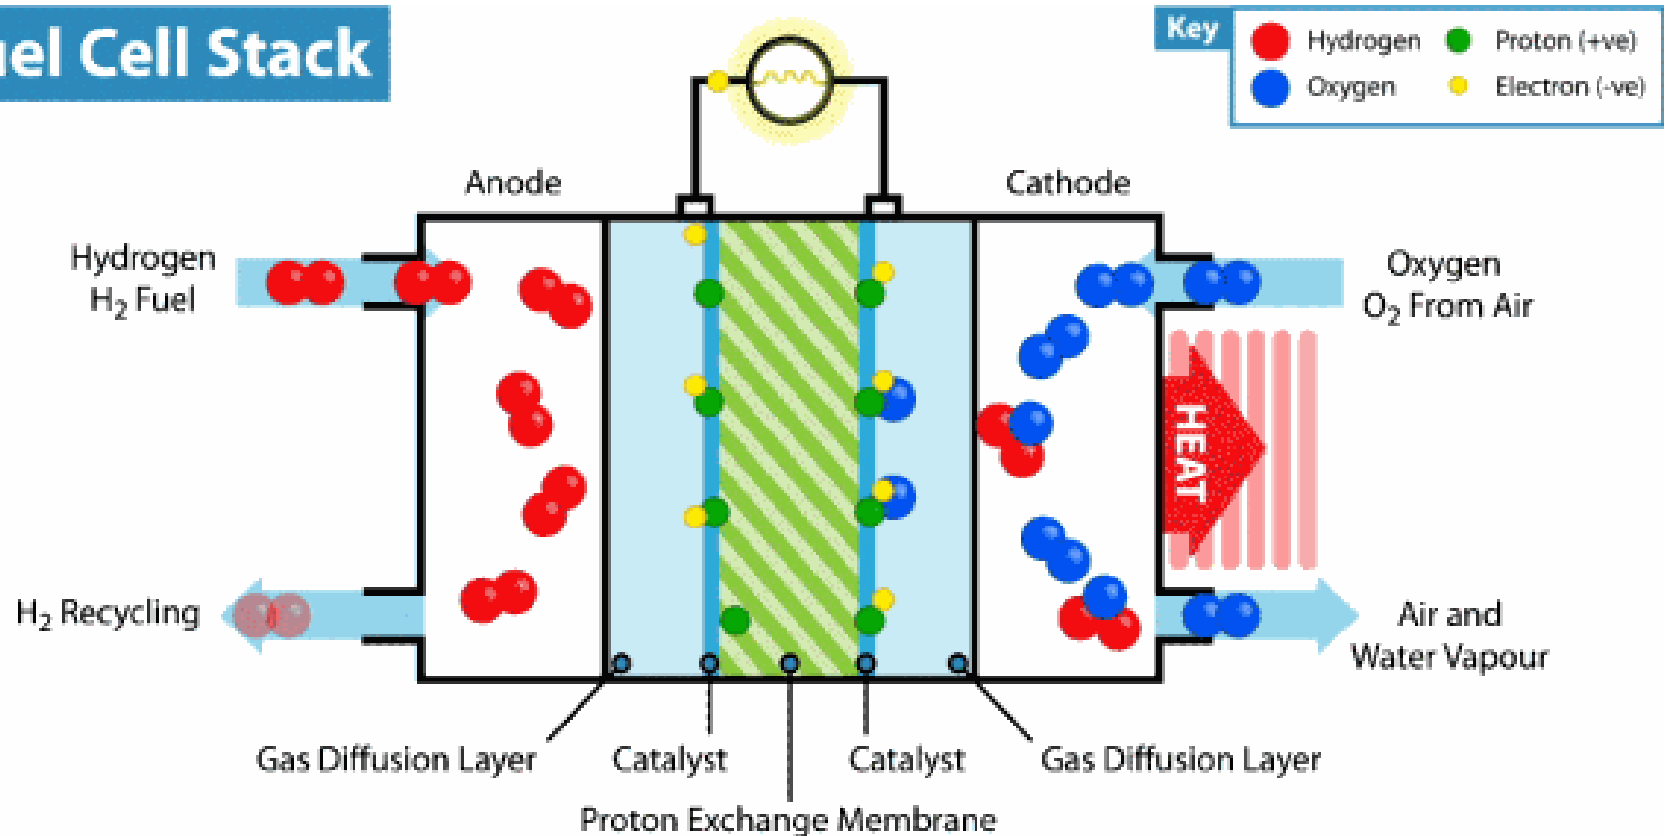

The top is a bilayer gold/silicon nitride membrane containing an array of cross-shaped nanoantennas etched into the gold layer. The bottom is a metal reflector that is separated from the gold/silicon nitride bilayer by a three-micron-wide air gap.

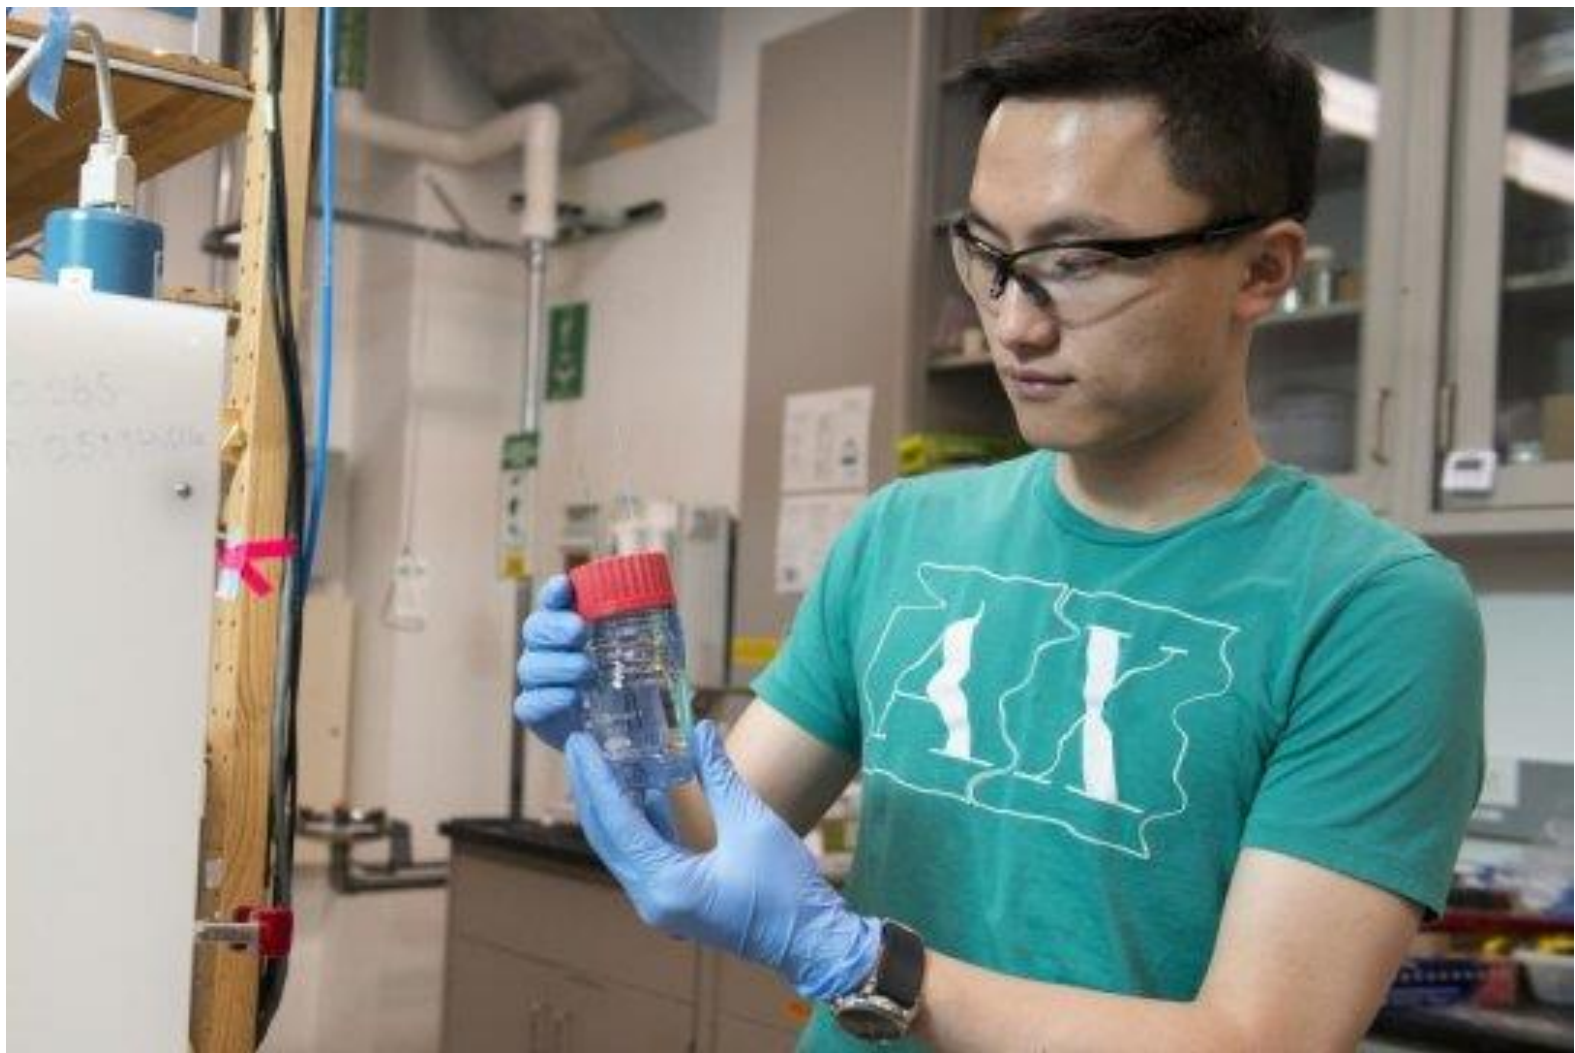

The device can potentially be used as a new frequency reference to accurately keep time in GPS, computers, wristwatches and other devices.

New Fuel Cell Catalyst (2016)

Fuel Cell Stack

A nanosize squeeze can significantly boost the performance of platinum catalysts that help generate energy in fuel cell.
